this textbook is designed with the needs of today's student in mind. It is the ideal textbook for a first course in elementary differential equations for future engineers and scientists, including mathematicians. This book is accessible to anyone who has a basic knowledge of precalculus, algebra, and differential and integral calculus. Its

carefully crafted text adopts a concise simple no frills approach to differential equations which helps students acquire a solid experience in many classical solution techniques with a lighter accent on the physical interpretation of the results a more manageable page count than comparable texts a highly readable style and over 1000 exercises designed to be solved without a calculating device this book emphasizes the understanding and practice of essential topics in a succinct yet fully rigorous fashion apart from several other enhancements the second edition contains one new chapter on numerical methods of solution the book formally splits the pure and applied parts of the contents by placing the discussion of selected mathematical models in separate chapters at the end of most of the 246 worked examples the author provides the commands in mathematica for verifying the results the book can be used independently by the average student to learn the fundamentals of the subject while those interested in pursuing more advanced material can regard it as an easily taken first step on the way to the next level additionally practitioners who encounter differential equations in their professional work will find this text to be a convenient source of reference

in the first part of this ems volume yu v egorov gives an account of microlocal analysis as a tool for investigating partial differential equations this method has become increasingly important in the theory of hamiltonian systems egorov discusses the evolution of singularities of a partial differential equation and covers topics like integral curves of hamiltonian systems pseudodifferential equations and canonical transformations subelliptic operators and poisson brackets the second survey written by v ya ivrii treats linear hyperbolic equations and systems the author states necessary and sufficient conditions for  $C$  and  $L^2$  well posedness and he studies the analogous problem in the context of gevrey classes he also gives the latest results in the theory of mixed problems for hyperbolic operators and a list of unsolved problems both parts cover recent research in an important field which before was scattered in numerous journals the book will hence be of immense value to graduate students and

researchers in partial differential equations and theoretical physics
